How you combined your prototypes A and B, and how you made design decisions during this process?

For prototypes A and B, Our group member use distinct ways to design, we made the prototype more functional and made the prototype B more concise and intuitive. Both styles are popular in current software market. After the testing during the semester, we got more feedback that they prefer to use prototype A, because for a food recommending application, more choice seems to be far more attractive. Therefore, in the final prototype, we decide to modify the prototype A and add some feature and advantages from prototype B into it. Besides combining the prototype A and prototype B, we also avoid usability issues we have met in the previous test. The usability issues and its resolution process is presented in the table below.

A table of usability issues from the previous study, and an explanation of how you resolved them in the final prototype?

Usability issues	Explanation	Solution
Useless coupon options	In the prototype A, we create the coupon options in the user profile for people used in restaurant, but it did not have any real function.	Delete this options and personalize the user profile and the restaurant profile to fill the blank of erased coupon options
Missing keyboard for	In the first page after	Add the keyboard

search engine	logging in, we have the search button that enable users to direct find the restaurant, but we forgot to create keyboard for the search engine	options under the search engine
Missing button access to the personal profile	In the draft prototype, we forget to add link in our app to our final page, the final page is the user profile, so the user can not see the profile page	Add the conspicuous button for the user to sign up and enter their Personal profile.
